1. BLOCK DIAGRAM

2. OPERATIONS (See Block Diagram)

2-1. Features of servo-lock tuning system

The use of servo-lock tuning system makes it possible to eliminate tuning error in FM section, maintain a stable receiving, and accurately select an optimum tuning point at which the distortion is minimum and the separation is best.

2-2. Operations of servo-lock tuning system

The servo-lock tuning system comprises a local oscillator section including a variable capacitance diode (dD1), a servo circuit including an operational amplifier (sIC1a and sIC1b) to amplify an AFC voltage applied from an FM detector IC, and a switching circuit (sQ1) to switch AFC operations.

The tuning error can be eliminated by applying a servo voltage to the variable capacitance diode provided in a tuning circuit of the FM front-end local oscillator section.

A. Operation of servo-lock tuning system in detuning

A signal applied to the variable capacitance diode is switched from the reference signal to the servo signal by a muting signal generated from the terminal No. 12 of the FM detector IC (dIC1).

In detuning, since the muting signal becomes a H-voltage level, sQ3 is on and sQ1 is also on; accordingly, the servo signal is not applied to the variable capacitance diode dD1, but the reference voltage signal from the terminal No. 10 of dIC1 is applied to dD1.

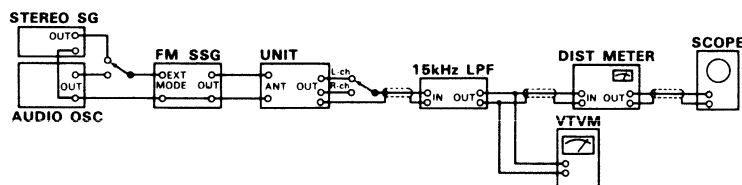

B. Operation of servo-lock tuning system in receiving

In receiving FM broadcasting, since the muting signal from the terminal No. 12 of the FM detector IC (dIC1) becomes a L-voltage level, sQ3 is off and sQ1 is also off; accordingly, the AFC signal from the terminal No. 7 of dIC1 is amplified through the operational amplifier sIC1a and sIC1b and then applied to the variable capacitance diode dD1.

Therefore, in case some tuning error occurs due to, for instance, temperature drift, the operational amplifier detects a difference in voltage level between AFC voltage signal and reference voltage signal. This servo signal outputted from the operational amplifier controls the oscillation frequency of the local oscillator section so as to eliminate the tuning error, thereby an optimum tuning point being obtainable at all times.
